Abstract

In today's digitally connected world, people often struggle to find like-minded individuals for shared activities, while many individuals with skills and talents lack suitable audiences, resources, venues, or opportunities to showcase and share them. People may want to play sports but lack teammates, participate in cooking, music, or technology sessions, share knowledge, or organise small events with limited budgets. At the same time, talent and small-scale creators face uncertainty regarding audience interest and investment before conducting an activity.

Vynk is proposed as an AI-powered platform that connects people based on their **interests, skills, activities, availability, location, and intent** through intelligent recommendation and matching. Users can discover suitable individuals or groups for sports, entertainment, education, cooking, music, technology, knowledge sharing, and other real-world or online activities. The platform enables users to create activities or events in advance, collect expressions of interest, estimate potential participation, and determine suitable budgets and ticket prices before making investments.

The platform also enables **cross-domain collaboration**, allowing individuals with complementary interests or businesses to participate in shared experiences. For example, an event organiser can connect with food or refreshment providers, creating opportunities for both participants and small contributors. AI-driven recommendations continuously identify relevant people, activities, collaborations, and communities while privacy-aware discovery and trust mechanisms support safer interactions.

The primary objective of Vynk is to reduce social isolation, increase meaningful human connectivity, encourage talent, enable affordable participation, facilitate knowledge sharing, and create opportunities for collaborative experiences and micro-businesses through one intelligent platform.
